This consent does not extend to other kinds of copying, such as copying for general distribution, for advertising or promotional purposes, for creating new collective works, or for resale. For such uses, written permission is required.

ACKNOWLEDGMENTS

The author wishes to thank the Virginia Agricultural Experiment Station and the many cooperators and contributors who provided the resources needed for conducting this applied research program. Dr. Darcy Partridge, Post-doctoral Research Associate, joined our team in March 2005 and provided leadership in testing new transgenic lines of peanut for resistance to Sclerotinia blight. Dr. Partridge also provided professional help in making disease assessments in the field and presenting results during tours attended by growers, county agents, university faculty, workers in private industry, and commodity group leaders. Special recognition is extended to Barron Keeling, Steve Byrum and Ed Hobbs for technical skills to operate the Peanut/Cotton InfoNet, maintain four weather stations, manage 37 field trials, collect accurate records, process data, and help in preparing this report. The assistance of Dr. Benjy Cline at Virginia Tech in updating programs for the Peanut/Cotton InfoNet was greatly appreciated. Dr. Dave Walker also deserves recognition for running climatological models and issuing frost advisories for peanut on the Peanut/Cotton InfoNet. Carolyn Daughtrey, Brenda Kennedy, and Linda Harrell are recognized for assistance in stand counts, flower counts, growth measurements, and harvesting transgenic peanuts with a stationary picker. Dr. John Eisenback and Diane Reaver of the Department of Plant Pathology, Physiology & Weed Science contributed to this research by processing and identifying nematode populations in soil samples from cotton, soybean and peanut trials.

 Valent U.S.A. Corp., Cary, NC

POLICY FOR ACCEPTANCE OF PESTICIDES FOR TESTING

Research on synthesis and exploration of agricultural chemicals and biotechnology for use in pest control continues to provide new materials for field evaluation. Compounds are being made available by private companies and universities for local research in a variety of ways; ranging from a sample with a code number to a thoroughly-tested material, with secure patents, technical data sheets, and comprehensive résumés of results of laboratory and field trials. Unfortunately, it is not possible for a scientist to include all materials and use patterns in a field research demonstration program. Therefore, materials are selected according to (i) overall need for a product in a particular crop or problem area, and (ii) overall promise of the material to improve crop management at the local level.

Before a material can be accepted for testing, the following descriptive information is required: (i) a list of the spectrum of biological activity, (ii) data on phytotoxicity and suggested rates of application, (iii) methods of application, (iv) formulations available, (v) mammalian toxicity (LD_{50}), (vi) possible health hazards, and (vii) possible hazards to the environment. Additional information that would be desirable includes: (i) identity of the active ingredient(s) and inert materials, (ii) physical properties (solubility, MP, VP, stability, etc.), (iii) residue information, (iv) residual soil life, (v) EPA residue tolerance (if any) and registration status, (vi) patent status, and (vii) unit cost in commercial markets.

Upon completion of field applications, it is the responsibility of the sponsor to dispose of all unused test materials. Because of limited space in controlled pesticide storage facilities and expenses associated with shipping and disposal, all sponsors are encouraged to ship not more than 1.5 times the anticipated quantity needed to complete a test.

INTRODUCTION

Rainfall in May and Oct was 0.95 and 2.22 in. above normal and in Apr, Jun, Jul, Aug, and Sep was 0.92, 1.61, 0.71, 1.25, and 1.38 in. below normal, respectively. Rainfall during the period totaled 28.25 in. which was 2.7 in. below normal (Appendix Tables 128, 129). Minimum air temperatures averaged near normal ($\pm 1^{\circ}\text{F}$) in Apr and May, 2°F above normal in Jun, 3°F above normal in Sep, 4°F above normal in Jul and Aug, and 6°F above normal in Oct. Maximum air temperatures were near normal ($\pm 1^{\circ}\text{F}$) in Apr, Jun and Oct, 2°F below normal in May, 3°F above normal in Aug, 4°F above normal in Jul and 5°F above normal in Sep according to records from a NOAA station at the Tidewater AREC in Suffolk (Appendix tables 126, 127). Cool temperatures and frequent rainfall in May slowed the speed of emergence in field crops. However, most crops were planted in a timely manner and showed good emergence by two to three weeks after planting throughout Eastern Virginia. Seasonal heat units for peanut from May 1 to October 31 totaled 2932 in Suffolk, which was well above the 2500 to 2600 needed for maturity (Table 1). Cotton degree-days (DD₆₀) in the same period totaled 2297 which was 116 above the average for 1995 to 2004. As the harvest season approached, many fields exhibited normal maturity and good yield potential. No frost damage was observed in peanuts, since the first killing frost did not occur until the end of October.

Peanut yields in 2005 are projected to average 2900 lb/A (Table 2). Excesses of moisture in May were favorable for Cylindrocladium black rot (CBR), which was the most destructive disease of peanut in 2005 (Table 3). The second most damaging disease in peanut was northern root knot nematode. Early leaf spot and late leaf spot caused some defoliation in late September and early October, but the incidence of web blotch was generally low due to above normal temperatures from Jul through October. The incidence of tomato spotted wilt virus (TSWV) was considered low in 2005 and similar to levels seen in 2004. Southern stem rot appeared to be higher than in previous years, which may be attributed to warmer than normal temperatures in 2005. Certainly, the warmer temperatures helped in suppression of losses to Sclerotinia blight. Overall, the continued reduction in peanut acreage has resulted in many acres of peanut being planted at 4-year intervals after 3 years of cotton. This cropping system is likely to benefit peanut by reducing the incidence and severity of disease and yield losses caused by CBR, nematodes, leaf spots, and Sclerotinia blight.

Cotton yields in 2005 are projected to average 835 lb or 1.74 bales/A. Only a few diseases caused significant damage in cotton production. Rhizoctonia damping-off and other seedling diseases caused minor losses of stand and no impact on yield. Poor stands were often associated with soil compaction by heavy rainfall immediately after planting and/or planting seed too deep (deeper than 0.75 in.). The optimum depth of planting is usually 0.25 to 0.5 in. Crop damage by southern root-knot nematode, *Meloidogyne incognita*, accounted for the heaviest loss of yield in fields planted continuously to cotton for 5 years or longer. No significant losses to reniform nematode, *Rotylenchulus reniformis*, were detected in 2005. Instances of yield losses to stubby root were found, but overall were less destructive than southern root knot. Sting nematode continues to be highly damaging to cotton, but occurrences are usually confined to small portions of fields. As in previous years, the Columbia lance nematode was not detected in the region in 2005. Below normal rainfall in 2005 was thought to suppress development of hardlock in cotton since disease incidence was not observed to exceed one or only a few locules in up to 10% of open bolls.

Powdery mildew, Stagonospora leaf blotch, and tan spot were the most common diseases of wheat in southeastern Virginia. Leaf blotch and tan spot accounted for the greatest reductions of yield in the region. Stripe rust was widely scattered throughout southeastern Virginia, and only a few fields exhibited heavy disease pressure near the end of the growing season. Occurrences of scab on heads were minimal in 2005 and had little or no impact on yield.

Corn yields are forecast to be 124 bu/A or 22 bushels below the record set in 2000. Dry weather stress was likely the single most important factor that depressed yields in 2005. The widespread occurrence of stubby root nematode and isolated patches of sting nematode were thought to account for most of the yield losses to disease in corn. Stalk rots and foliar diseases caused minor damage in the Tidewater area in 2005.

The December forecast for soybean yield in 2005 was 29 bu/A with an expected harvest of 520,000 acres in Virginia. Nematodes were thought to have the greatest impact on yield of all soybean diseases in 2005 (Table 4). Soybean cyst, southern and northern root-knot and stubby root nematodes probably accounted for the greatest losses of yield. Frogeye leaf spot, anthracnose, and Cercospora blight appeared to be the most common foliar diseases of soybean. Frogeye leaf spot was the most aggressive and widespread during pod filling through the R₅ stage of reproductive growth, but leaves appeared to be able to tolerate high numbers of lesions with minimal defoliation. Thereafter, Cercospora blight appeared to be the most aggressive disease in the final four weeks of the growing season. Laboratory examinations of more than 350 leaf samples of soybeans from June through October in eastern Virginia failed to detect soybean rust in 2005. In addition, several samples of Kudzu were examined and none exhibited soybean rust.

The research described in this book was designed to evaluate strategies for improving disease control and the overall efficiency of crop production in Virginia. Commercial products are named for informational purposes only. Virginia Cooperative Extension, Virginia Polytechnic Institute and State University, and Virginia State University do not advocate or warrant those products named nor do they intend or imply discrimination against those not named.

The primary purpose of this book is to provide a summary of research for cooperators and contributors in various projects. Nineteen chapters from this book have been prepared for publication by the American Phytopathological Society in *Fungicide & Nematicide Tests*, and *Biological & Cultural Tests* in 2006. Reprints of these publications are available upon request.

Table 1. Comparison of rainfall, peanut heat units (DD₅₆) and cotton degree-days (DD₆₀) over the period from 1995 to 2005.

Month	Rainfall (in.)

Table 2. Crop production in record year for yield compared to 2005.

Crop	Statistics of record year for yield			2005 projection*		
	Year	Acreage	Yield/A	Acreage	Yield/A	
Peanut.....	2004	32,000	3,250 lb	22,000	2,900 lb	
Soybean.....	2004	530,000	39.0 bu	520,000	29 bu	
Corn.....	2000	330,000	146 bu	360,000	124 bu	
Cotton (lint)..	2004	81,000	956 lb	92,000	835 lb	
Wheat	1997	260,000	67 bu	170,000	66 bu	

* Based on crop production estimates in November and December 2005 by the Virginia Agricultural Statistics Service at <http://www.nass.usda.gov/va>.

Table 3. Estimated loss in yield as a result of peanut diseases in 2005.

Disease	Causal organism	Percent loss
Early leaf spot	<i>Cercospora arachidicola</i>	2.0
Late leaf spot.....	<i>Cercosporidium personatum</i>	0.2
Pepper spot & leaf scorch	<i>Leptosphaerulina crassiasca</i>	0
Web blotch.....	<i>Phoma arachidicola</i>	0.5
Botrytis blight	<i>Botrytis</i> sp.	0
Peanut rust.....	<i>Puccinia arachidis</i>	ND*
Sclerotinia blight.....	<i>Sclerotinia minor</i>	1.0
Sclerotinia blight.....	<i>Sclerotinia sclerotiorum</i>	ND*
Southern stem rot	<i>Sclerotium rolfsii</i>	1.0
Stem, root, & pod rot	<i>Rhizoctonia</i> spp.	0.1
Botrytis blight	<i>Botrytis</i> sp.	Trace
Pythium pod rot.....	<i>Pythium</i> spp.	Trace
Tomato spotted wilt virus	<i>Tospovirus</i>	1.0
Cylindrocladium black rot (CBR)....	<i>Cylindrocladium parasiticum</i>	6.0
Nematode damage.....	Root knot, sting, ring, etc.	3.0
Total		14.8**

* Not detected.

** The value of loss estimate equals 2.36 million dollars in farm income based on an estimated total production of 31,900 tons and a mean value of \$425 per ton in Virginia.

Table 4. Estimated loss in yield as a result of soybean diseases in 2005.

Disease	Causal agent(s)	Percent loss
Seedling diseases	---various---	0.5
Downy mildew	<i>Peronospora manshurica</i>	Trace
Frogeye leaf spot.....	<i>Cercospora sojina</i>	1.5
Phytophthora root & stem rot	<i>Phytophthora megasperma</i> f.sp. <i>glycinea</i>	0
Anthracnose	<i>Colletotrichum truncatum</i>	1.0
Pod & stem blight	<i>Diaporthe phaseolorum</i> var. <i>sojae</i>	0.5
Stem canker.....	<i>Diaporthe phaseolorum</i> var. <i>caulivora</i>	0.1
Sclerotinia stem rot	<i>Sclerotinia sclerotiorum</i> and <i>S. minor</i>	0
Southern blight.....	<i>Sclerotium rolfsii</i>	0.2
Root & lower stem rot.....	<i>Rhizoctonia</i> spp.	Trace
Purple seed stain	<i>Cercospora kikuchii</i>	0.2
Cercospora blight.....	<i>Cercospora kikuchii</i>	0.8
Brown spot	<i>Septoria glycines</i>	0.5
Red crown rot.....	<i>Cylindrocladium parasiticum</i>	0.3
Brown stem rot.....	<i>Phialophora gregata</i>	0.3
Charcoal rot.....	<i>Macrophomina phaseolina</i>	Trace
Viruses	SMV, PMV, BPMV, etc.	Trace
Bacterial pustule.....	<i>Xanthomonas phaseoli</i>	Trace
Bacterial blight.....	<i>Pseudomonas glycinea</i>	0.2
Soybean cyst nematode.....	<i>Heterodera glycines</i>	2.0
Other nematodes	various	1.9
Total loss (%).....		10.0*

* The loss estimate equals 1.71 million bushels based on production of 15.37 million bushels in 2005. At a value of \$5.50/bu, the loss in revenues at the farm gate would be 9.41 million dollars.

I. FUNGICIDES FOR DISEASE MANAGEMENT IN WHEAT (TAREC, Swine Unit Field)

- A. PURPOSE: To compare the efficacy of fungicides in control of foliar and head diseases of wheat, and the yield response to various treatments
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks with 20-ft alleyways between blocks
 - 2. Twenty, 30-ft rows per plot
 - 3. Disease ratings and yield determined in the center, seven rows/plot
- C. APPLICATION OF TREATMENTS: Treatments were applied in a foliar spray with a Lee Spider sprayer having eight, 8002VS nozzles spaced 18 in. apart and delivering a spray volume of 16 gal/A.
- D. TREATMENT, RATE/A AND APPLICATION TIMING: (GS=Growth Stage: GS 32 = 11 Apr; GS 45 = 9 May)
 - 1. Untreated check
 - 2. Quilt 10.5 fl oz (GS 32)
 - 3. Quilt 5.25 fl oz (GS 32) + 5.25 fl oz (GS 45)
 - 4. Quilt 10.5 fl oz (GS 45)
 - 5. Quadris 2.08SC 6 fl oz (GS 32) + Coverall 2.4 fl oz
 - 6. Quadris 2.08SC 3 fl oz (GS 32) + Coverall 2.4 fl oz
+ Quadris 2.08SC 3 fl oz (GS 45) + Coverall 2.4 fl oz
 - 7. Quadris 2.08SC 6 fl oz (GS 45) + Coverall 2.4 fl oz
 - 8. Headline 250EC 6 fl oz (GS 32) + Coverall 2.4 fl oz
 - 9. Headline 250EC 3 fl oz (GS 32) + Coverall 2.4 fl oz
Headline 250EC 3 fl oz (GS 45) + Coverall 2.4 fl oz
 - 10. Headline 250EC 6 fl oz (GS 45) + Coverall 2.4 fl oz
- E. ADDITIONAL INFORMATION:
 - 1. Location: TAREC Swine Unit Field, Suffolk
 - 2. Crop history: peanut 2004; wheat/soybean 2003, peanut 2002
 - 3. Land preparation: disk and field cultivate
 - 4. Planting date and cultivar: 22 Nov 2004, USG 3209
 - 5. Soil fertility report: (Dec 2004)

pH.....	6.1
Ca	585 ppm
Mg	71 ppm
P	32 ppm
K.....	113 ppm
Zn	1.0 ppm
Mn	3.7 ppm
Soil type	Nansemond fine sandy loam
 - 6. Fertilizer: 9-15-36 350 lb/A (26 Oct 2004)
 - Liquid nitrogen (32%) 60 lb/A (12 Jan)
 - Liquid nitrogen (30%) 60 lb/A (22 Mar)
 - 7. Herbicide: Harmony Extra 0.75 oz/A (12 Jan)
 - 8. Harvest date: 21 Jun 2005

Table 5. Effect of fungicide treatments and timing on severity of foliar disease in wheat.

Treatment, rate/A and application timing	Powdery mildew*		Tan spot*	Tan spot + Septoria*
	Top of plant	Mid-plant	(May 18)	(Jun 5)

* Data represent percent of leaf area on flag leaf with disease symptoms.

** Yields are weight of wheat with 13.5% moisture. One bushel equals 60 lbs. Wheat was harvested on 21 Jun 2005.

Means followed by the same letter(s) in a column are not significantly different (LSD, P=0.05 except yield P=0.0627). Arcsine transformation of percentage data was made in analysis to determine statistical significance.

II. THE EFFECT OF PLANTING DATE, WEATHER CONDITIONS AND IN-FURROW FUNGICIDE ON EMERGENCE AND GROWTH OF COTTON (TAREC Research farm)

A. PURPOSE: To determine the effect of planting date on seedling disease and the response to in-furrow fungicide in Virginia

B. EXPERIMENTAL DESIGN:

1. Split-plot with planting date in main plots and in-furrow fungicide in subplots
2. Subplots of two, 30-ft rows spaced 36 in. apart
3. Fifteen-ft alleyways between blocks
4. Seven replications in a randomized complete block

C. VARIETY, GERMINATION RATE AND PLANTING DATE (MAINPLOTS): DP449BR Lot 2B4E490621A, Treatment Code 2 (Allegiance + Lorsban 30FL + RTU Baytan + Thiram FL); warm germ 93%, cool germ 849%. Seed were planted at a rate of 3.5 seed/ft and 0.5 to 0.75 in. depth.

* Data are counts in two, 30-ft rows per plot.

**Weight (lb/A) includes lint + seed; bales/A are lint only. Lint was 39.8% of seed cotton according to ginned 1 lb samples (1 bale of lint=480 lb). Plots were harvested on 17 Oct 2005.

Means followed by the same letter(s) in a column are not significantly different according to Student-Newman-Keuls test (P=0.05).

IV. IMPACT OF STAND REDUCTIONS ON GROWTH AND YIELD OF COTTON (TAREC Research farm)

- A. PURPOSE: To determine the effect of reductions in populations of seedlings on growth and yield of cotton in Virginia
- B. EXPERIMENTAL DESIGN:
 - 1. Split-plot design with planting date in main plots and stand reductions in subplots
 - 2. Subplots of two, 40-ft rows with 36-in. row spacing
 - 3. Fifteen-ft alleyways between blocks
 - 4. Four replications in randomized complete block
- C. VARIETY AND PLANTING DATE (MAINPLOTS): DP449 BG/RR seed, Lot 2B4-E-406-21A (warm germ 93%, cool germ 84%); Treatment code 2 (Allegiance + Lorsban 30FL + RTU Baytan + Thiram FL). Seed were planted at 4 seed/ft and 0.5 to 0.75 in. depth.
 - 1. Apr 19
 - 2. May 3
 - 3. May 18
- D. STAND REDUCTION: plants in 4-ft sections were removed from each 40-ft row on 9 Jun
 - 1. None
 - 2. 20% = two 4-ft sections/row
 - 3. 40% = four 4-ft sections/row
 - 4. 60% = six 4-ft sections/row
- E. ADDITIONAL INFORMATION:
 - 1. Location: Tidewater Research farm, Hare Rd., Suffolk
 - 2. Crop history: peanut 2004, corn 2003, peanut 2002
 - 3. Land preparation: rip-strip tilled
 - 4. Soil fertility report (Dec 2004):

¹ Determined from counts of two, 40-ft rows per plot.² Data are measurements of four plants per plot.³ Weight (lb/A) includes lint + seed; bales/A are lint only. Lint yield was determined by ginning samples from each plant date and was 480 lb/bale. Plots were harvested on 17 Oct 2005.

Means followed by the same letter(s) in a column and within the same plant date are not significantly different according to Fisher's Protected LSD (P=0.05). "n.s." =not significant; "--" denotes LSD not valid because of significant plant date by stand reduction interaction.

V. RESPONSE OF COTTON TO IN-FURROW FUNGICIDE (TAREC Research farm)

- A. PURPOSE: To compare the efficacy and benefits of in-furrow treatments for control of seedling disease
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks with 15-ft alleyways between blocks
 - 2. Two, 30-ft rows per plot with 36-in. spacing
 - 3. Seeding rate of three seed/row ft
- C. APPLICATION OF TREATMENTS: All treatments were applied to the seed furrow when planting. Liquid in-furrow treatments were mixed in water and applied at a volume of 5 gal/A through a microtube to the seed furrow. Granular in-furrow fungicides were delivered by a Noble-box applicator.
- D. TREATMENT AND RATE (per 1000 ft of row):

* Total number of flowers in 6-ft section from each row.

** Weight (lb/A) includes lint + seed; bales/A are weight of lint only. One-pound samples were ginned and lint determined to be 41% of total weight and 480 lb/bale. Plots were harvested on 17 Oct 2005.

Means followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD test (P=0.05).

VI. RESPONSE OF COTTON TO NEMATICIDES AND INSECTICIDES (Kenny Edwards Farm, Branchville, VA)

- A. PURPOSE: To determine the growth and yield response of cotton to treatments with nematicides and insecticides at planting
- B. EXPERIMENTAL DESIGN:
 1. Four randomized complete blocks
 2. Alleyways between blocks of 15 ft planted to cotton
 3. Two, 30-ft rows spaced 36 in. apart per plot
- C. APPLICATION OF TREATMENTS: Soil fumigant was applied 8 in. deep with a single chisel per row (C) on 26 Apr and rows were bedded after application (24 in. wide and 4 in. high). Granular in-furrow treatments (F) were applied to the seed furrow at planting. Band treatments (B) were 8 in. wide and applied over rows during cultivation on 29 Jun. Seed treatments (S) were applied by Bayer CropScience.
- D. TREATMENT AND RATE:
 1. Untreated check

* S=seed treatment, F=in furrow.

** Yield was determined by hand picking two, 6-ft sections of rows in each plot on 20 Oct. Weight (lb/A) includes lint + seed; bales/A are lint only. Lint of seed cotton was determined by ginning samples from each variety.

Means followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD (P=0.05). "n.s." =not significant.

VIII. EVALUATION OF SEED TREATMENTS FOR NEMATODE CONTROL IN COTTON
 (Rick Morgan farm, Suffolk, VA)

- A. PURPOSE: To compare the efficacy and benefits of nematicide treatments and variety selection for control of southern root-knot nematode in cotton production
- B. EXPERIMENTAL DESIGN:
 - 1. Split-plot design with four randomized complete blocks separated by 15-ft alleyways
 - 2. Two, 30-ft rows per plot with 36-in. row spacing
 - 3. Seeding rate of three seed/row ft
- C. APPLICATION OF TREATMENTS: Vapam 42% was applied 8 in. under rows on 26 Apr with a chisel applicator (C). In-furrow treatments (F) were applied to the seed furrow at planting. Seed treatments (S) were applied by Syngenta Crop Protection.
- D. TREATMENT AND RATE (Main plots): seed treatments are expressed as active ingredient; in-furrow treatments are formulated product.
 - 1. Dynasty CST 125FS 0.03 mg + Cruiser 5FS 0.34 mg/seed (S)
 - 2. Dynasty CST 125FS 0.03 mg + Cruiser 5FS 0.34 mg + A14006 0.15 mg/seed (S)

* S=seed treatment, F=in-furrow, C=chisel applicator.

** Weight (lb/A) includes lint + seed; bales/A are lint only. Lint of seed cotton was determined by ginning 1-lb. samples from each variety and was 480 lb/bale. Plots were harvested on 8 Nov 2005.

Means in groups followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD (P=0.05).

IX. YIELD AND GROWTH RESPONSE OF COTTON VARIETIES TO TEMIK 15G FOR CONTROL OF SOUTHERN ROOT KNOT NEMATODE (Rick Morgan Farm, Suffolk, VA)

- A. PURPOSE: To compare the susceptibility of commercial cotton varieties to southern root-knot nematode (*Meloidogyne incognita*) and assess their response to treatment with Temik 15G 5 lb/A in the seed furrow
- B. EXPERIMENTAL DESIGN:
 - 1. Split-plot design with varieties in main plots and subplots with and without Temik 15G
 - 2. Four randomized complete blocks separated by 15-ft alleyways
 - 3. Two, 30-ft rows per plot with 38 in. row spacing
 - 4. Seeding rate of 3 to 3.5 seed/row ft
- C. VARIETY (Main plots):
 - 1. DP 434 RR
 - 2. DP 444 BG/RR
 - 3. ST 5599 BR (partially-resistant standard)
 - 4. ST 5242 BR

X. RESPONSE OF COTTON TO FOLIAR BAS500 FUNGICIDE WITH PENTIA FOR CONTROL OF HARDLOCK IN VIRGINIA (TAREC)

- A. PURPOSE: To evaluate the efficacy of foliar fungicide and growth regulator for suppression of hardlock.
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks separated by 10-ft alleyways
 - 2. Two, 30-ft rows per plot with 36-in. row spacing
 - 3. Seeding rate of four seed/row ft
- C. APPLICATION OF TREATMENTS: All treatments were applied with 8002VS nozzles spaced 18-inches apart and delivering 16.5 gal/A. Pentia 8 fl oz/A was applied at the following times:
 - 1st spray: Pin head-flower bud (GS51-55): 5 Jul
 - 2nd spray: Early-mid bloom (GS61-65): 21 Jul
 - 3rd spray: 10-50% full size bolls (GS71-75): 15 Aug
- D. TREATMENT AND RATE/A:
 - 1. No fungicide
 - 2. BAS500 00F 6.14 fl oz (7/5, 7/21)
 - 3. BAS500 00F 9.2 fl oz (7/5, 7/21)
 - 4. BAS500 00F 3.07 fl oz (7/5, 7/21, 8/21)
 - 5. BAS500 00F 6.14 fl oz (7/5, 7/21, 8/21)
 - 6. BAS500 00F 9.2 fl oz (7/5, 7/21, 8/21)
- E. ADDITIONAL INFORMATION:

LSD	n.s.	n.s.

* Weight (lb/A) includes lint + seed; bales/A are weight of lint only. Lint was 45% of total weight and 480 lb/bale. Plots were harvested on 7 Nov 2005.

"n.s." = not significant at P=0.05 according to Fisher's Protected LSD.

XI. RESPONSE OF COTTON TO FOLIAR QUADRIS FUNGICIDE WITH AND WITHOUT PIX PLUS FOR CONTROL OF HARDLOCK IN VIRGINIA (TAREC)

- A. PURPOSE: To evaluate the efficacy of foliar fungicide and growth regulator for suppression of hardlock.
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks separated by 10-ft alleyways
 - 2. Two, 30-ft rows per plot
 - 3. Seeding rate of four seed/row ft
- C. APPLICATION OF TREATMENTS: All treatments were applied with 8002VS nozzles spaced 18-inches apart and delivering 16.5 gal/A. Pix Plus was applied as needed according to Virginia Tech recommendations. Applications of Quadris w/ and w/o Pix Plus were timed as close as possible to first bloom and 14 days later.
- D. TREATMENT AND RATE/A:
 - 1. Pix Plus 10 fl oz alone as needed, but at least 3 days before or after Quadris (7/21, 8/4)
Quadris 2.08SC 6.2 fl oz at 1st bloom and 14 days later (7/18, 8/1)
 - 2. Pix Plus 10 fl oz + Quadris 2.08SC 6.2 fl oz at 1st bloom and 14 days later (7/18, 8/1)
 - 3. Pix Plus 10 fl oz alone at same timing as treatments 2 and 5 (7/18, 8/1)
 - 4. Pix Plus 10 fl oz alone as needed, but at least 3 days before or after Quadris (7/21, 8/4)
Quadris 2.08SC 9.2 fl oz at 1st bloom and 14 days later (7/18, 8/1)
 - 5. Pix Plus 10 fl oz + Quadris 2.08SC 9.2 fl oz at 1st bloom and 14 days later (7/18, 8/1)
- E. ADDITIONAL INFORMATION:

XIII. EVALUATION OF SEED TREATMENTS FOR CONTROL OF SEEDLING DISEASES OF PEANUT (TAREC Research farm)

- A. PURPOSE: To compare the efficacy of seed and in-furrow treatments for control of seedling diseases of peanut
 - B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks separated by 15-ft alleyways
 - 2. Two, 30-ft rows per plot
 - 3. Seeding rate of three seed/row ft
 - C. APPLICATION OF TREATMENTS: Dust and liquid treatments were applied to seed with a Gustafson lab treater. The volume of liquid treatment was standardized at 12 fl oz/cwt by dilution with water. Seed were planted ca. 2 in. deep and spaced ca. 4 in. apart with a KMC planter.
 - D. TREATMENT AND RATE:
 - 1. Untreated check
 - 2. Vitavax PC 4 oz/cwt
 - 3. Allegiance FL 0.75 fl oz/cwt
 - 4. Dynasty PD 3 oz/cwt
 - 5. KNF 4332 3 oz/cwt
 - 6. KNF 4332 2.5 oz/cwt
 - E. ADDITIONAL INFORMATION:
 - 1. Location: TAREC Research Farm, Hare Rd., Suffolk
 - 2. Crop history: Corn 2004; Peanut 2003, Corn 2002
 - 3. Planting date and cultivar: 2 May 2005, Perry, Seed Lot 313, 65% germination.
Biopsy of 50 seed prior to treatment found the following incidence of fungi in seed:
14% Rhizopus, 74% Penicillium, 8% Fusarium, 52% Aspergillus (flavus group), 12% Trichoderma.
 - 4. Soil fertility report:

pH.....	6.9	K	28 ppm
Ca	301 ppm	Zn.....	0.4 ppm
Mg	67 ppm	Mn.....	2.3 ppm
P	29 ppm	Soil type.....	Kenansville loamy sand
 - 5. Herbicide:
 - Pre-plant - Prowl 1 pt/A (31 Mar)
 - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (19 Apr)
 - Pre-emergence - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (13 May)
 - 6. Soil fumigation: Sectagon 42% 7.5 gal/A (18 Apr)
 - 7. Insecticide: Orthene 97S 6 oz/A (1 Jun, 14 Jun)
 - Lorsban 15G 13 lb/A (27 Jun)
 - 8. Acaricide: Danitol 6 fl oz/A (11 Aug, 22 Aug)
 - 9. Leaf spot control: Bravo WS 1.5 pt (18 Jul, 2 Aug, 22 Sep), Headline 9 fl oz/A (22 Aug)
 - 10. Additional crop management:
 - a. Liquid boron 1 qt/A (31 Mar)
 - b. Landplaster: Peanut Maker 1500 lb/A (23 Jun)
 - c. Liquid Mn 1 qt/A (6 Jun, 18 Jul, 2 Aug)
 - d. Irrigation: ca. 1 in. (24 Jun, 1 Sep, 6 Sep)
 - e. Cultivation: 27 Jun
 - 11. Harvest date: 5 Oct 2005

XV. EVALUATION OF SEED TREATMENTS FOR CONTROL OF EARLY-SEASON DISEASES OF PEANUT (Duke farm)

- A. PURPOSE: To compare the efficacy of experimental fungicides to reference standard seed treatments for control of early season diseases of peanut.
- B. EXPERIMENTAL DESIGN:
 - 1. Split-plot design with four randomized complete blocks separated by 15-ft alleyways
 - 2. Two, 30-ft rows per plot with 36-in. row spacing
 - 3. Seeding rate of three seed/ft of row
- C. APPLICATION OF TREATMENTS: Dust treatments were applied to seed with a Gustafson lab treater. Seed were planted 2 in. deep and spaced 4 in. apart with a KMC planter.
- D. TREATMENT AND RATE (Main plots): S=seed treatment
 - 1. Untreated check
 - 2. Vitavax PC 4 oz/cwt (S)
 - 3. L1292-A 4 oz/cwt (S)
 - 4. L1294 4 oz/cwt (S)

¹ Determined from counts of two, 35-ft rows per plot.

² Counts of plants per plot with symptoms of TSWV.

³ Number symptomatic and/or dead plants per plot, pre-harvest rating of virginia-type cultivars was 27 Sep; runner-type cultivars was 14 Oct.

Means followed by the same letter(s) within a group and column are not significantly different (LSD, P≤0.05). "n.s."=not significant.

¹ Root rot rating scale: 0=none, 10=total necrosis.

² Counts of infection centers in the two center rows of each plot or a total of 70 ft of row on 29 Aug. An infection center was a point of active growth by *Sclerotium rolfsii* and included 6 in. on either side of that point.

³ Root-knot nematode galling scale: 0=none, 10=100% of roots with galls. Ratings were made after digging (virginia-type=28 Sep; runner-type=17 Oct).

⁴ Yields are based on weight of peanuts with 7% moisture.

⁵ Composite samples were graded to determine market value at loan rate, and multiplied by yield to estimate value at farm gate (\$/A). Means followed by the same letter(s) within a grouping are not significantly different (LSD, P≤0.05). "n.s."=not significant.

¹ FM=foreign material, LSK=loose shelled kernels, FAN=fancy sized in-shell, ELK=extra large kernels, SS=sound splits, OK=other kernels, DK=damaged kernels, Conc. RMD=internal damage from rancidity, decay or mold, SMK=sound mature kernels. Data are from a composite sample from four reps of each cultivar.

² Value (¢/lb) represents the market value of peanuts based on the loan rate.

³ Segregation 2 price due to damage>2.5% or concealed RMD >1.0%.

XVIII. MANAGEMENT STRATEGIES FOR TSWV, NEMATODES AND CYLINDROCLADIUM BLACK ROT IN PEANUT (Wyne farm)

- A. PURPOSE: To evaluate foliar and in-furrow treatments, soil fumigant and cultivar selection for disease management
- B. EXPERIMENTAL DESIGN:
 - 1. Split-split-plot design with six randomized complete blocks separated by 15-ft alleyways
 - 2. Two, 35-ft rows per sub-subplot with 36-in. row spacing
 - 3. Seeding rate of three seed/row ft
- C. FOLIAR TREATMENT AND RATE/A (Main plots): Orthene 97S was applied at thrips threshold in untreated plots on 7 June 2005. Treatment was applied with 8004VS nozzles spaced 18-in. apart and delivered in a volume of 25 gal/A.
 - 1. Untreated
 - 2. Orthene 97S 8 oz/A
- D. SOIL TREATMENT AND RATE/A(Subplots): Chisel applications of Vapam 42% were applied 8 in. deep on April 21 and rows were bedded (24 in. wide and 4 in. high) during application. Granular treatments were applied in-furrow (F) at planting.
 - 1. Untreated check
 - 2. Temik 15G 5 lb (F)
 - 3. Thimet 20G 5 lb (F)
 - 4. KC791230 15G 5 lb (F)
 - 5. Vapam 42% 5 gal (C) + Temik 15G 5 lb (F)
- E. CULTIVAR: Sub-subplots
 - 1. VA 98R (CBR-susceptible)
 - 2. Perry (CBR-resistant)
- F. ADDITIONAL INFORMATION:
 - 1. Location: Wyne Farm, Suffolk
 - 2. Crop history: Corn 2004; Peanut 2003; Wheat/Soybean 2002
 - 3. Planting date: 17 May 2005
 - 4. Soil fertility report:

pH.....	6.2	K	37 ppm
Ca	348ppm	Zn.....	0.5 ppm
Mg	46 ppm	Mn.....	1.9 ppm
P	12 ppm	Soil type.....	Nansemond fine sandy loam
 - 5. Herbicide:
 - Pre-plant - Prowl 1 pt/A (19 Apr)
 - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (27 Apr)
 - Pre-emergence - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (23 May)
 - Post-emergence – Poast Plus 1 qt + ChemOil 2 pt/A (17 Jun)
 - 6. Insecticide: Lorsban 15G 13 lb/A (27 Jun)
 - 7. Acaricide: Danitol 6 fl oz/A (5 Aug, 22 Aug)
 - 8. Leaf spot control: Bravo WS 1.5 pt (18 Jul, 2 Aug, 22 Sep), Headline 9 fl oz/A (22 Aug)
 - 9. Additional crop management:
 - a. Liquid boron 1 qt/A (31 Mar)
 - b. Liquid Mn 1 qt/A (20 Jun, 18 Jul, 2 Aug)
 - c. Landplaster: Peanut Maker 1500 lb/A (28 Jun)
 - 10. Harvest date: 18 Oct 2005

XIX. EVALUATION OF FUNGICIDES AND SOIL FUMIGATION FOR CONTROL OF SOILBORNE DISEASES OF PEANUT (TAREC Research farm)

A. PURPOSE: To compare the efficacy of in-furrow and foliar fungicides to soil fumigant for disease control

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks separated by 15-ft alleyways
2. Two, 35-ft rows per plot with 36-in. spacing
3. Seeding rate of four seed/ft of row

C. APPLICATION OF TREATMENTS: Sectagon 42% (metam sodium) was applied with a chisel (C) 8 in. deep on 18 Apr, and rows were bedded during application. In-furrow treatments (F) were applied in a volume of 5 gal/A through a microtube to the seed furrow. Foliar sprays were applied with three, D₃23 nozzles/row delivering 15 gal/A. The initial application was applied at flowering (R₁) and thereafter according to the Va. Peanut Leaf Spot Advisory Program until beginning maturity (R7).

D. TREATMENT AND RATE:

¹ F=in furrow (28 Apr). Foliar fungicides were applied beginning at R₁ growth stage (flowering) and thereafter according to the leaf spot advisory.

² Number of symptomatic plants per plot.

³ Web blotch rating scale: 0=none, 100=blotches on all leaflets. Note: ratings were also made on 27 Aug for CBR, southern stem rot, web blotch and sclerotinia blight. Only traces of these diseases were noted at that time.

⁴ Defoliation rating scale: 0=none, 100=no leaves on plants.

⁵ Yields are weight of peanuts with 7% moisture. Peanuts were dug on 3 Oct and harvested on 18 Oct.

Means followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD (P=0.05). "n.s." = not significant. Arcsine transformation of percentage data was made in analysis to determine statistical significance.

XXI. EVALUATION OF FUNGICIDES FOR CONTROL OF FOLIAR AND SOILBORNE DISEASES OF PEANUT (TAREC Research farm)

A. PURPOSE: To determine the importance of fungicide selection and sequences in programs for disease management

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks separated by 10-ft alleyways
2. Two, 35-ft rows per plot with 36-in. row spacing
3. Seeding rate of four seed/ft of row

C. APPLICATION OF TREATMENTS: Foliar sprays of fungicides were applied with three, D₃23 nozzles/row delivering 15 gal/A. The initial application was applied at flowering (R₁) and thereafter according to the Va. Peanut Leaf Spot Advisory Program until beginning maturity (R₇).

D. TREATMENT AND RATE/A:

LSD	n.s.	579

¹ Fungicides were applied at the R₃ growth stage (beginning seed) and thereafter according to the Va. Peanut Leaf Spot Advisory Program until beginning maturity (R₇).

² Number of symptomatic plants per plot.

³ Yields are weight of peanuts with 7% moisture. Peanuts were dug on 17 Oct and harvested on 26 Oct 2005.

Means followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD (P=0.05). "n.s." = not significant.

XXIII. SUSCEPTIBILITY OF VIRGINIA- AND RUNNER-TYPE PEANUTS TO FOLIAR DISEASES (TAREC Research farm, Suffolk)

A. PURPOSE: To assess disease and yield of cultivars in the absence of fungicide treatments

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks
2. Two, 20-ft rows per plot with 36 in. row spacing
3. Fifteen-ft alleyways between blocks

C. CULTIVAR: V=virginia-type; R=runner-type

1. Perry (V)
2. VA 98R (V)
3. Gregory (V)
4. GA Hi/OL (V)
5. DP-1 (R)
6. Hull (R)
7. GA Green (R)
8. GA-02C (R)
9. GA-03L (R)
10. C99R (R)

D. ADDITIONAL INFORMATION:

1. Location: TAREC Research Farm, Hare Rd., Suffolk
2. Crop history: corn 2004, cotton 2003, peanut 2002
3. Planting date: 17 May
4. Soil fertility report:

pH.....	5.9
Ca	209ppm
Mg	23 ppm
P	31 ppm
K.....	34 ppm
Zn	0.5 ppm
Mn	2.2 ppm
Soil type	Kenansville loamy sand
5. Herbicide:
 - Pre-plant - Prowl 1 pt/A (31 Mar)
 - Pre-emergence - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (19 May)
 - Post-emergence – Poast Plus 2 pt + ChemOil 1 pt/A (21 Jul)
6. Cylindrocladium black rot control: Vapam 7.5 gal/A (19 Apr)
7. Insecticide: Temik 15G 7 lb/A in furrow (17 May)
 - Orthene 97S 6 oz/A (7 Jun)
 - Lorsban 11 lb/A (27 Jun)
8. Acaricide: Danitol 6 fl oz/A (29 Aug)
9. Additional crop management:
 - a. Liquid boron 1 qt/A (31 Mar)
 - b. Liquid Mn 1 qt/A (20 Jun)
 - c. Irrigation: ca. 1 in. (24 Jun, 11 Aug, 2 Sep, 13 Sep)
 - d. Landplaster: Peanut Maker 1500 lb/A (22 Jun)
 - e. Cultivation: 27 Jun, 22 Jul
10. Harvest date: 26 Oct 2005

* FAN=fancy sized in-shell, ELK=extra large kernels, SS=sound splits, OK=other kernels, DK=damaged kernels, SMK=sound mature kernels. Data are from a composite sample from four reps of each cultivar.

** Value (\$/lb) represents the market value of peanuts based on the loan rate.

XXIV. EVALUATION OF FUNGICIDES FOR CONTROL OF SCLEROTINIA BLIGHT AND OTHER DISEASES OF PEANUT (TAREC)

A. PURPOSE: To compare the efficacy of fungicides for control of early leaf spot, web blotch, and Sclerotinia blight of peanut

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks separated by 10-ft alleyways
2. Four, 35-ft rows per plot with 36-in. row spacing
3. Seeding rate of four to five seed/ft of row

C. APPLICATION OF TREATMENTS: Foliar sprays of fungicides were applied with three, D₃23 nozzles/row delivering 14.8 gal/A. The initial application was applied at flowering (R₁) and thereafter according to the Va. Peanut Leaf Spot Advisory Program until beginning maturity (R₇). The Sclerotinia Advisory and scouting were used to determine timing of Omega and Endura (Trts 7, 8, 9, 10).

D. TREATMENT AND RATE/A:

1. Untreated check

XXV. EVALUATION OF FUNGICIDES FOR CONTROL OF EARLY LEAFSPOT AND SCLEROTINIA BLIGHT OF PEANUT (TAREC)

A. PURPOSE: To determine the dosage effect of experimental fungicides for control of early leaf spot, web blotch, Sclerotinia blight, and other diseases of peanut

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks separated by 10-ft alleyways
2. Four, 35-ft rows per plot with 36-in. row spacing
3. Seeding rate of four to five seed/ft of row

C. APPLICATION OF TREATMENTS: Foliar sprays of fungicides were applied with three, D₃23 nozzles/row delivering 14.8 gal/A. The initial application of fungicide was applied at flowering (R₁) and thereafter according to the Va. Peanut Leaf Spot Advisory Program until beginning maturity (R₇). Omega and Endura fungicide (Trt 3 and 4) were applied with Bravo 720 when recommended by Sclerotinia blight advisory.

D. TREATMENT AND RATE/A:

1. Untreated check
2. Bravo 720 1.5 pt (1st, 2nd, 3rd, 4th, 5th spray)
3. Bravo 720 1.5 pt (1st, 2nd, 3rd, 4th, 5th spray)
Substitute Bravo 720 1.5 pt + Omega 500 1 pt when recommended by Scl. Adv.
4. Bravo 720 1.5 pt (1st, 2nd, 3rd, 4th, 5th spray)
Substitute Bravo 720 0.75 pt + Endura 70WG 9 oz when recommended by Scl. Adv.
5. Folicur 3.6F 7.2 fl oz + Induce 1.2 fl oz (1st, 2nd, 3rd, 4th spray)
Bravo 720 1.5 pt (5th spray)
6. Bravo 720 1.5 pt (1st, 2nd, 5th spray)
Headline 250EC 9 fl oz (3rd, 4th spray)

E. ADDITIONAL INFORMATION:

1. Location: TAREC Research Farm, Hare Rd., Suffolk
2. Crop history: Corn 2004; Cotton 2003, Peanut 2002
3. Planting date and cultivar: 4 May 2005, NC 12C
4. Soil fertility report: (Dec. 2004)

pH.....	5.9	K.....	126 ppm
Ca	534 ppm	Zn	0.8 ppm
Mg	42 ppm	Mn	3.8 ppm
P	53 ppm	Soil type	Nansemond fine sandy loam
5. Herbicide:

Pre-plant - Prowl 1 pt/A (1 Apr)
Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (19 Apr)

Pre-emergence - Dual II Magnum 1 pt + Strongarm 0.23 fl oz/A (13 May)

6. Insecticide: Temik 15G 7 lb/A in furrow (4 May)

Orthene 97S 6 oz/A (27 May)
Lorsban 15G 11 lb/A (28 Jun)
Danitol 6 oz/A (22 Aug)
7. Cylindrocladium black rot control: Vapam 7.5 gal/A (19 Apr)
8. Additional crop management:
 - a. Liquid boron 1 qt (1 Apr)
 - b. Landplaster: Peanut Maker 1500 lb/A (23 Jun)
 - c. Liquid Mn 2 qt/A (20 Jun, 18 Jul)
 - d. Cultivation: 28 Jun
9. Harvest date: 27 Oct 2005

* Based on 10 randomly selected taproots per plot of Perry on 17 Oct. Taproot tissue was assayed using Agdia TSWV immunoassay strips.

** Yields are weight of peanuts with 7% moisture. Peanuts were dug on 17 Oct and harvested on 26 Oct; Means followed by the same letter(s) in a column are not significantly different according to Fisher's Protected LSD (P=0.05). "n.s." = not significant.

XXIX. SUSCEPTIBILITY OF VIRGINIA- AND RUNNER-TYPE CULTIVARS OF PEANUT TO
TOMATO SPOTTED WILT VIRUS (Wyne Farm, Suffolk)

A. PURPOSE: To determine the value of TSWV resistance in new runner-type cultivars and compare the disease response and yield to virginia-type cultivars

B. EXPERIMENTAL DESIGN:

1. Four randomized complete blocks
2. Ten-ft alleyways between blocks
3. Two, 35-ft rows per plot with 36-in. row spacing
4. Seeding rate of 3 to 4 seed/ft of row

C. CULTIVARS (V = virginia-type; R = runner-type)

* Counts of infection centers in two-row plot or a total of 50 ft of row. An infection center was a point of active growth by *Sclerotinia minor* and included 6 in. on either side of that point. AUDPC = area under the disease progress curve from 9 Sep to 27 Oct.

** Yields are weights of peanuts with 7% moisture. Peanuts were dug on 1 Nov and harvested on 9 Nov.

Means followed by the same letter(s) in a parent group and column are not significantly different according to Fisher's Protected LSD (P=0.05).

XXXI. EVALUATION OF SEED TREATMENTS FOR NEMATODE CONTROL IN SOYBEAN
(TAREC Research farm)

- A. PURPOSE: To compare the efficacy and benefits of seed and in-furrow treatments for nematode control
- B. EXPERIMENTAL DESIGN:
 - 1. Split-plot design with four randomized complete blocks separated by 15-ft alleyways
 - 2. Four, 30-ft rows in main plots and varieties in subplots of two rows
 - 3. Row spacing was 36 inches
 - 4. Seeding rate was ca. 7 seed/ft of row
- C. APPLICATION OF TREATMENTS: all rates are active ingredient. Syngenta Crop Protection applied seed treatments. Temik 15G was applied to the open seed furrow (F) at planting.
- D. TREATMENT AND RATE (MAIN PLOTS): all rates are product active ingredient
 - 1. Apron Maxx RFC 6.25 g/100 kg seed
 - 2. Apron Maxx RFC 6.25 g/100 kg seed + STAN 500FS 0.1 mg/seed
 - 3. Apron Maxx RFC 6.26 g/100 kg seed + STAN 500FS 0.2 mg /seed
 - 4. Apron Maxx RFC 6.25 g/100 kg seed + STAN 500FS 0.1 mg/seed
+ Cruiser 5FS 50 g/100 kg seed
 - 5. Apron Maxx RFC 6.25 g/100 kg seed + Temik 15G 0.75 lb/A (F)
- E. VARIETIES (SUBPLOTS): two rows of each variety
 - 1. Pioneer 95B42 (Susceptible to soybean cyst and southern root-knot)
 - 2. Pioneer 95B43 (Partially resistant to soybean cyst and southern root-knot)
- F. ADDITIONAL INFORMATION:
 - 1. Location: Tidewater Research Farm, Hare Rd., Suffolk, VA
 - 2. Crop history: 2004 peanut, 2003 wheat/soybean, 2002 peanut
 - 3. Planting date: 23 May 2005
 - 4. Soil fertility report:

pH	6.6
Ca	297 ppm
Mg	46 ppm
P	31 ppm
K	42 ppm
Zn	0.9 ppm
Mn	2.0 ppm
Soil type	Goldsboro fine sandy loam
 - 5. Herbicide: Prowl 1 pt/A (23 May)
Roundup Ultra Max 22 fl oz/A (13 Jun, 19 Jul)
 - 6. Harvest date: 1 Nov, 12 Nov 2005 (combine breakdown and weather delay)

* Yield of soybeans with 13.5% moisture. One bushel equals 60 lb. Soybean harvest began on 1 Nov and was finished on 12 Nov due to an equipment breakdown.

"n.s." = means are not significantly different according to Fisher's Protected LSD (P=0.05).

XXXII. FUNGICIDES FOR CONTROL OF SOYBEAN RUST AND COMMON DISEASES OF SOYBEAN IN VIRGINIA (TAREC, Swine Unit Field)

- A. PURPOSE: To collect data needed to recommend fungicides for control of soybean rust, brown spot, anthracnose, frogeye leaf spot, pod and stem blight, and other soybean diseases in Virginia
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks
 - 2. Fifteen-ft alleyways between blocks
 - 3. Two, 30-ft rows at 36 in. spacing in each plot
- C. APPLICATION OF TREATMENTS: Treatments were applied in a foliar spray with 8002VS nozzles spaced 18 in. apart and delivering a spray volume of 16 gal/A.
 - 1st Preventative = Aug 16 (R₃)
 - 2nd Preventative = Aug 29 (R₅)
 - 1st Curative = Aug 29 (R₅)
- D. TREATMENT AND RATE/A:
 - 1. Untreated check
 - 2. Folicur 432SC 4 fl oz (1st spray-preventative, 2nd spray-preventative)
 - 3. Folicur 432SC 4 fl oz (1st spray-preventative)

XXXIII. FUNGICIDES FOR CONTROL OF SOYBEAN RUST AND COMMON DISEASES OF SOYBEAN IN VIRGINIA (TAREC, Swine Unit Field)

- A. PURPOSE: To collect data needed to recommend fungicides for control of soybean rust, brown spot, anthracnose, frogeye leaf spot, pod and stem blight, and other soybean diseases in Virginia
- B. EXPERIMENTAL DESIGN:
 - 1. Four randomized complete blocks
 - 2. Fifteen-ft alleyways between blocks
 - 3. Two, 32-ft rows at 36 in. spacing in each plot
- C. APPLICATION OF TREATMENTS: Treatments were applied in a foliar spray with 8002VS nozzles spaced 18 in. apart and delivering a spray volume of 16 gal/A. Applications were made at beginning pod stage (R_3 - pods ca. 0.25 in. long at 4th node down from top of plant).
- D. TREATMENT AND RATE/A:
 - 1. Untreated check
 - 2. Folicur 432SC 4 fl oz (R_3)
 - 3. Quadris 6 fl oz + Crop Oil Conc. 21 fl oz (R_3);
 - 4. Stratego 250EC 7 fl oz + Induce 0.125% v/v (R_3)
